

# HDB++ Meeting 09/2019

ALBA Infrastructure

# Archiving infrastructure: Accelerators and Beamlines

- Beamlines use TDB/HDB in virtual machines
- Accelerators store 11000 attributes in HDB++:
  - Attributes distributed in 6 Mysam databases based on subsystem
    - rf, vc, di, acc, ct, pc, sizes between 40G-60G per month
  - Writing database contains only last 6 monthly partitions, older data is available in another server (that can be decimated).
  - 11000 attributes stored also in legacy TDB extended to 6 months.
    - 4000 attributes still to be migrated from TDB to HDB++
  - We implement both periodic and event-based archiver for HDB++
  - Backup by mysqldump restricted by table and date.

# Archiving Tasks for 2019

## Archiving (Accelerators)

### Archiving infrastructure

80%

All databases partitioned by subsystems to improve maintainability

Speed of searches increased by a factor of 10 (in last 3 months data) without reducing resolution (down to 10 Hz)

Maintenance scripts for backup/restore ready, **automation pending**

Two new servers for long storage archiving (archiving05/archiving06)

### Archiving client api / usability

80%

API refactored to provide access to multiple databases from multiple hosts

API integrated in new Taurus version using tangoarchiving schema

### Archiving plotting / usability

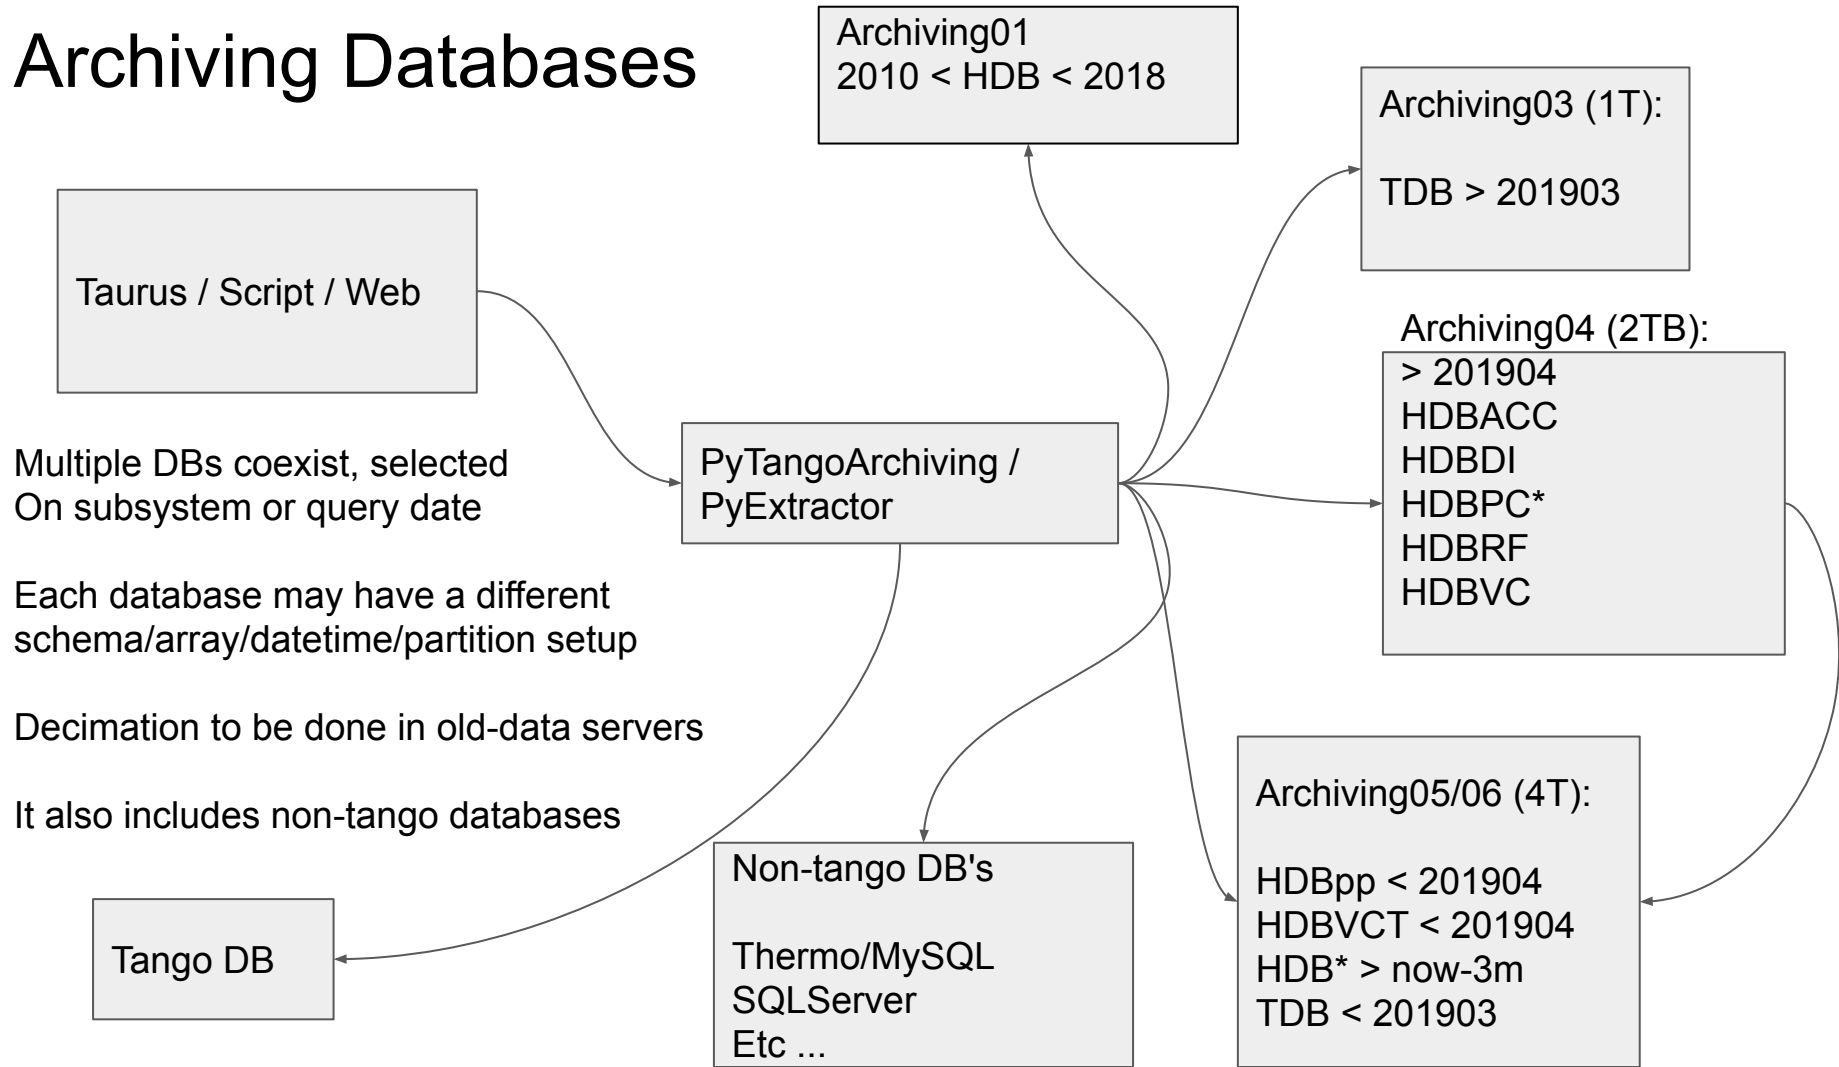

25%

- PyQtgraph-based plotting infrastructure
  - Support tango archiving by integrating taurus\_tangoarchiving

### Contributions to phase II/III beamlines

New Archiving/Plotting tools to be deployed in all new beamlines

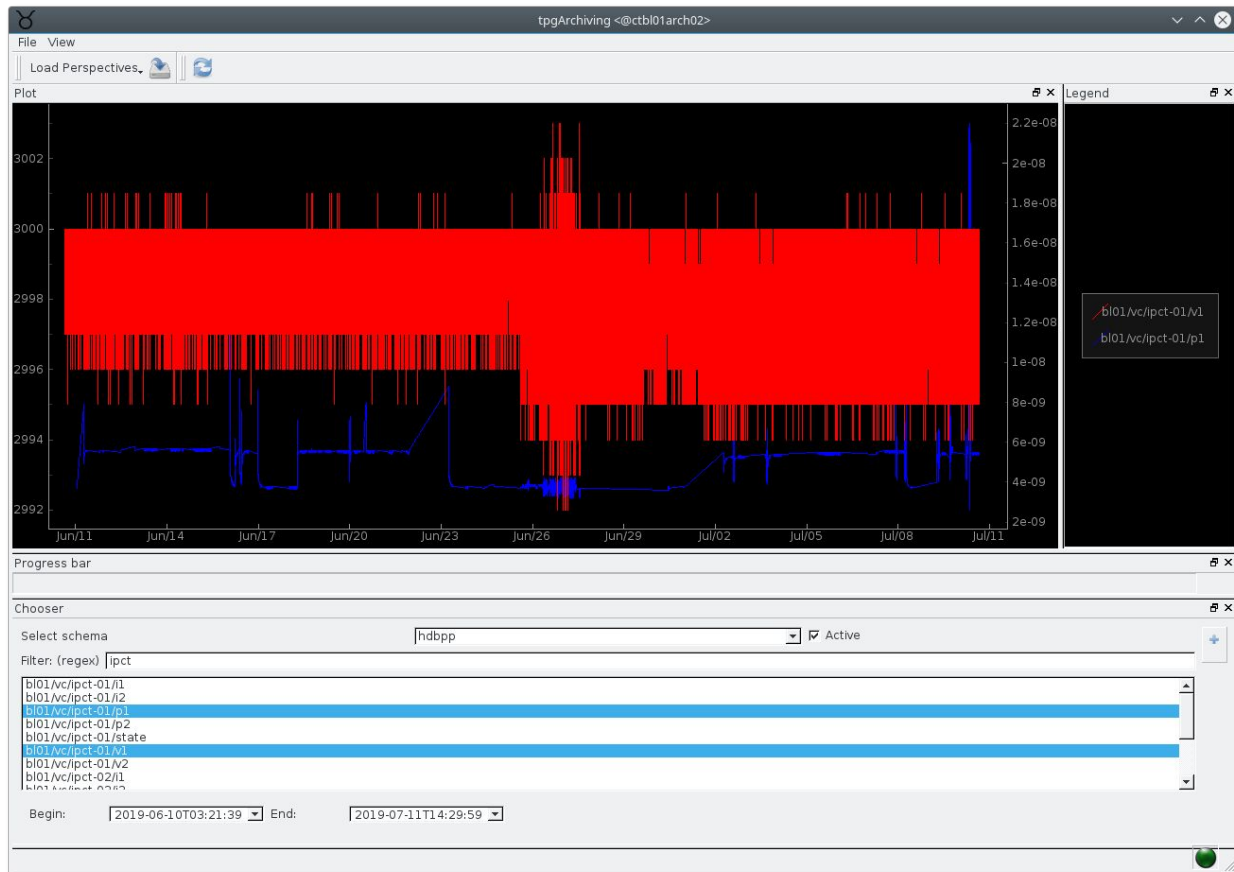

# Archiving Databases

# New Plotting Tool: PyQtGraph

Under test on

BL01/Miras

Archiving Status	Problems	Solutions adopted
<ul style="list-style-type: none"> <li>Jan 2017: HDB/TDB was the old Tango archiving system, running at Alba since 2007, storing 15000 attributes.</li> <li>Resolution limited to 1Hz for last week; 0.1Hz for last 3 years.</li> </ul>	<ul style="list-style-type: none"> <li>Values at 3 Hz were requested, to be kept for 3 months.</li> <li>HDB/TDB was obsolete and hard to maintain (<b>~180 hours to recover after crash</b>).</li> </ul>	<ul style="list-style-type: none"> <li>The new HDB++ archiving developed by ESRF allowed acquisition at 10Hz.</li> <li>Deployed at Miras/Accelerators using MariaDB servers since January 2017.</li> </ul>
<ul style="list-style-type: none"> <li>Summer 2017: The new HDB++ required an event-based control system.</li> <li>It needed to modify configuration of service area servers.</li> <li>Storing at 3Hz increased the amount of data available.</li> </ul>	<ul style="list-style-type: none"> <li>The increase of data traffic overloaded some CPU's, that we needed to optimize.</li> <li>In paral.lel, the amount of data to manage for both servers and client became unmanageable.</li> </ul>	<ul style="list-style-type: none"> <li>Beginning 2018, we started collaboration with the ESRF to solve these problems.</li> <li>Modified HDB++ to reduce the CPU load.</li> <li>Modified the database schema to reduce the data usage and add monthly partitioning.</li> </ul>
<ul style="list-style-type: none"> <li>Spring 2018: Due to CPU load issues, our plan was to not shutdown HDB/TDB, but to introduce HDB++ progressively.</li> </ul>	<ul style="list-style-type: none"> <li>HDB disks failed before summer 2018, and we had to modify TDB to keep 1 year of data during the migration.</li> <li>Clients (Mambo) unable to show old data.</li> </ul>	<ul style="list-style-type: none"> <li>Summer 2018 we accelerated the migration to HDB++.</li> <li>Modified archiving tools to correlate data from old and new databases.</li> </ul>
<ul style="list-style-type: none"> <li>Winter 2018: HDB++ timestamp had milliseconds resolution, which provides more useful information but extra load for indexing on client/server sides.</li> <li>Big database indexes were too slow to backup and restore.</li> </ul>	<ul style="list-style-type: none"> <li>The amount of memory and disk used by servers and clients grow exponentially.</li> <li>Tools developed for HDB++ maintenance were not fitted to the amount of data stored (same problems for ESRF lead to full redesign of system HW).</li> </ul>	<ul style="list-style-type: none"> <li>Winter 2018, added decimation on data and plotting to reduce clients load.</li> <li>Easter 2019, reduced server load and maintenance splitting databases by subsystem (size reduced by a factor of 10).</li> </ul>
<ul style="list-style-type: none"> <li>Summer 2019: HDB++ system currently running and stable in service area.</li> <li>We store <b>10400 attributes, inserting 1500 values/second</b> on average.</li> <li>This is as much data as ESRF+MaxIV+Solaris+Elettra together</li> </ul>	<ul style="list-style-type: none"> <li>We are using 2TB disk/year; which is not a daily issue but a long-term problem for backup, restore and data availability.</li> <li>The amount of data to be retrieved by query (2e6 points/week) is still too big for our current plotting tools (loading is slow, but still 3X times faster than using ESRF tools).</li> </ul>	<ul style="list-style-type: none"> <li>Databases modified to reduce indexes, speeding up extraction backup and restore (<b>~8 hours</b>).</li> <li>Re-introduced periodic mode for slow values.</li> <li>Two new servers for long-term storage.</li> <li>New plotting tool (PyQtGraph) to be deployed in control room during summer 2019.</li> </ul>
